PROFESSIONAL SUMMARY

Highly motivated Flutter Developer with a track record of developing and deploying multiple mobile applications. Strong communication skills and a passion for learning new programming languages. Committed to delivering high-quality code and continuously expanding expertise in cross-platform development.

PROJECTS

Store Info & Control, Deployed

<https://play.google.com/store/apps/details?id=com.elmurodjon.shopinfo>

- The app has supposed to give info about the address and show the location of individual, as well as store. it is a simple app to better organize store in a more smart way. The app does not require access to the background location, it only uses the foreground location service. Thus, once the user closes the app, app stops using location services. App uses: Gsheets as back-end for storing data, Firebase Auth for Authentication, Google map to show the location of particular place, as well as user's, Firebase Cloud message for push notifications

Notes App, Deployed

<https://play.google.com/store/apps/details?id=com.elmurodjon.notesapp>

- Notes app helps users manage and organize their notes effectively. It features a user-friendly interface, beautiful icons, grid layout, secure data storage, seamless state management, local storage, splash screen, custom app icons, visual effects.

News App, On github

https://github.com/Elmurodjon01/news_app_with_riverpod

- Simple two page news app. The app uses riverpod as state management solution and go_router to route the pages. it is very simple app with couple of pages. One is main_page and the other one is detail. As data source, the news.org api has been used through dio package to call for news data. have tried to make the app as flexible as possible for different size screens.

Recipe / Exchange Rate App, On github

<https://github.com/Elmurodjon01/Recipe-app>

- I have tried to play with dependency injections with different pages. I had a plan of using API to generate recipes, but most of the APIs are having changes as time passes, leading app to crash if app has been tried to run later. as this is sample project, I have only used dummy data inside app instead of API. But as this project was intended to practise calling data from APIs, I have added one more exchangeRate page to show daily exchange rates of NBU bank using its free API.

Tic Tac Toe, On github

<https://github.com/Elmurodjon01/tic-tac-toe-in-flutter>

- Simple tictactoe game in flutter, Tried to work on the logic of the app works behind the scene

SKILLS

Flutter Dart Provider

riverpod Go Routing

Mobile App Development SDK

Firebase Authentication

Cloud firestore Cloud Functions

Push Notifications Local Storage

Google Map GSheets

Google play console

PROJECTS

Calculator App, On github

🔗 https://github.com/Elmurodjon01/flutter_calculator

- In this app, I have got a lot experience with drawing UI. Even though it was single page single app, there were a lot to learn about UI, as well as paring data types.
